Re: ADA Accessibility Survey and Assessment – Child Care Center

Dear Gabriel,

We are pleased to submit this report for the Child Care Center. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

Syrnoun Z. Sanossian, Principal

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on October 25, 2015. The exterior site elements were assessed originally as part of the pedestrian facilities assessment in June-September 2011 and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access, to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

The Beaver Beginnings Child Care Center is considered a historic structure and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No “perfect” building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire on the part of OSU to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways;

1. Narrative Analysis: The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified but also provides a discussion that analyses the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

NOTE: Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. Barrier Data Records: Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.

In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.
A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve the Beaver Beginnings Child Care Center. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks as paved surfaces improved for use by pedestrians but walkways are not located along or adjacent to the curb line, gutter or roadway and walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.

As a public building that was constructed prior to the passage of the ADA, the Beaver Beginnings Child Care Center should have at least one accessible entrance. An accessible entrance was identified at this building at the parking lot on the south side of the building located within a security vestibule. Due to security concerns, the provision of one accessible entrance to this building is appropriate.
The Beaver Beginnings Child Care Center has an accessible route provided within the site from accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public transportation stops to the accessible building or facility entrance they serve\(^1\) as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided within the ADA Assessment and Survey of the pedestrian facilities provided as a separate report, as well as in the following records. Please see the barrier data records for details.

B. Building Entrances

The building is located between 12\(^{th}\) and 13\(^{th}\) Street on SW Adams Avenue on the east border of campus. Parking is provided on-site in a surface lot. An ISA directional sign is posted in the view panel of the door but the entry door and vestibule door are not provided with automatic door opening devices. The security doorbell is located next to the door jamb which could be problematic if a person using a wheelchair is actuating the doorbell, they may be in the path of the out-swinging door.

INTERIOR SPACES

The Beaver Beginnings Child Care Center is a single-story building with three separate exterior play areas for different age groups and interior classrooms, common areas, corridors and restrooms. The public entrance was located within a vestibule and both doors were identified as heavy with closing speed that was not accessible. The doorbell was also located within the vestibule next to the entry door and within the door swing space. The door mat at the entry door was also not secured. Tactile signage was not provided at the exit side of the vestibule doors and an ISA sign was posted on the entry door although it was identified as too heavy to operate. The vestibule entrance door was also identified with a 6” high threshold. The entry lobby was identified with a seating area and floor rug that may present a trip hazard. Flyers and other materials were located in a cabinet outside of accessible reach ranges. The office entrance door was blocked open and the door operating force could not be tested. Much of the signage in the building, including at the office, provided visual information but lacked tactile information (Braille and raised letters) for the visually impaired.

The building was equipped with a fire alarm but visual signal appliances are provided in only 2 of 10 classrooms but not in other common use areas (classrooms) or restrooms. The corridors were identified with a lack of visual signal appliances (strobes) needed to alert the hearing impaired individuals in the building of an alarm. Drinking fountains in corridors were not located within alcoves or otherwise provided with detectable warnings for people with vision impairments who travel within the building.

Barriers that were commonly identified throughout the building in common use areas and include entrance doors that lacked accessible signage and doors often lacked view panels that were accessible to short people or wheelchair users. Maneuvering clearance at classroom doors was often blocked by tables that not only reduced strike edge clearance but blocked clear floor space at

---

\(^1\) 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points
information boards and sign-in lists posted above the table on the wall adjacent to the classroom entrance doors.

Classrooms also lacked accessible work tables, art easels, art tables, and floor mats in many locations were not secured and could create trip hazards or hinder wheelchair travel. Sinks, drinking fountains and work counters in classrooms were also not accessible to children using wheelchairs and the high counters and sinks were also not accessible. Toilet rooms in classrooms were not identified with accessible signage, maneuvering clearance, toilet seat height, grab bars, dispensers or other accessible elements.

Classrooms were identified with multiple learning areas that had different types of tables (round, rectangular, blue art tables, easels, etc.) and each learning area should have at least one accessible table to allow children using wheelchairs to participate in each activity equally. Rubberized door mats at sink landings and some learning areas in classrooms were identified with an uneven surface that was not only 1” high but could trap wheelchair wheels or other types of mobility assist devices (canes, walkers, etc.).

Exit doors to play areas were identified with door mats that were not secured, heavy doors and in some locations, the transition from door landing to asphalt surface was identified with a lip that could create a trip hazard or hinder wheelchair travel.

Unisex restrooms were located in the central corridor. The restrooms were identified with a number of barriers such as heavy entrance doors, a lack of accessible signage (tactile signs or signs identifying the restrooms as accessible) and large counters that blocked maneuvering clearance at the toilets. The rooms were designed with adequate space but the counters were larger than needed and blocked access. The counters were also not mounted with accessible knee clearance and dispensers were not mounted within accessible reach ranges. Rubberized door mats (see photo at right) at sink landings within restrooms were identified with an uneven surface that was not only 1” high but could trap wheelchair wheels or other types of mobility assist devices (canes, walkers, etc.).

**EXTERIOR PLAY AREAS**

The play areas were provided in three locations and used according to classroom and age groups. The exit doors to the play areas were identified with un-secured door mats and some were also identified with trip hazards at the transition from concrete door landing to asphalt surface. Play components were located in grass areas or in areas with wood chips as a play surface, which does not provide attenuation to protect children who fall when playing, or a firm
and stable pedestrian surfaces to enable travel for mobility assist devices. In another area, a sandbox with a curb is accessible as the curb acts as a transfer platform for children using wheelchairs from which they can transfer from their chair and into the sandbox (see photo above).

Two picnic tables are located in the play area and one picnic table was located on an elevated, covered platform. This particular picnic table under a sun cover was not located on an accessible route. Where a covered picnic area is provided, an accessible table should be provided under the covered area. Other play components were not provided with a firm and stable connecting route from the building or asphalt play surface. Benches located in the play area were not identified with accessible dimensions.

The following barrier data records provide more detailed information on the barriers described above.
