Re: ADA Accessibility Survey and Assessment – Kidder Hall

Dear Angelo,

We are pleased to submit this report for Kidder Hall. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on May 2, 2013. The exterior site elements were assessed originally as part of the pedestrian facilities assessment in June-September 2011 and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

Kidder Hall is a historic structure and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No “perfect” building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire on the part of OSU to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways;

1. Narrative Analysis: The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified but also provides a discussion that analyses the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

NOTE: Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. Barrier Data Records: Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.
In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.

A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve Kidder Hall. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing on one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks as paved surfaces improved for use by pedestrians but walkways are not located along or adjacent to the curb line, gutter or roadway and walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.
As a public building that was constructed prior to the passage of the ADA, Kidder Hall should have at least one accessible entrance, which was identified at the south main entrance. The Kidder Hall Addition also provides an accessible entrance, which is connected to the original building through an accessible route on at least one level of the building. The Kidder Hall Addition building was not part of this part of the assessment process.

Kidder Hall has an accessible route provided within the site from accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public transportation stops to the accessible building or facility entrance they serve as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided in the following barrier data records and within the ADA Assessment and Survey of the pedestrian facilities provided as a separate report. An example of these barriers are the existing curb ramps at the intersection of SW Waldo Place and Campus Way, which were identified with minor barriers to access. Please see the barrier data records in Section 10 for details.

B. Building Entrances

The building is located on a corner of a major pedestrian way and across from the Memorial Union building. Pedestrian entrances are provided at the north and south sides of the building. The south entrance was identified with an accessible ramp and a stairway. The north entrance was identified with a stairway providing vertical access and an ISA directional sign was posted in the window of the entryway on the north side of the building.

A secondary pedestrian entrance on the north side of the building acted as a delivery area and did not appear to function as an entry commonly used by pedestrians according to our observations during the site visit. Directional signage is important but it is also essential to place it in strategic locations for maximum effect. A double-sided ISA directional sign posted along the north side of the pedestrian path in front of the building should be adequate to inform on-coming pedestrians of the location of and route to the south accessible entrance for both of the non-accessible entrances on the north side of the building. ISA directional signs should also be posted at the stairway entrances on the east and west sides of the building. No parking is provided on-site but on-street accessible parking is located south of the building along SW Waldo Place.

The accessible entrance on the south side of the building is equipped with an automatic door opening device and the actuator is a motion sensor located on the façade of the building in a location where on-coming pedestrians can actuate the mechanism without having to go out of their way or stop during travel, but the actuator is not identified visually as an automatic door opening device that can be seen from a distance (see

---

1 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points
photo at right). To the right of the photo, the existing ISA directional sign can be seen on the façade of the building. Over time, the sign has become faded. It is recommended that the sign be renewed to provide visual confirmation to on-coming pedestrians.

As a performance standard, it is recommended that where a powered door is provided in a building or facility, a sign displaying the International Symbol of Accessibility (ISA) measuring at least 4” x 4” should accompany the automatic door actuating mechanism (motion sensor).

INTERIOR SPACES

BASEMENT

Kidder Hall is a three-story building with a basement. The basement houses classrooms, graduate student offices where students meet, IT shops, media labs and public spaces. The office of the Statistics Department is located in the basement. Conference rooms and a library for the Statistics department are also located on the basement level. Barriers identified in the basement were commonly identified throughout the building in common use areas: entrance doors to offices lacked accessible clear width, signage, door hardware, door closer operating force/sweep period where door closers were installed and in many instances, the entry doors lacked accessible maneuvering clearance due either to the location of structural elements, furniture or other items that encroached into the space needed by wheelchair users to maneuver. The lack of accessible maneuvering clearance may necessitate the installation of automatic door opening devices in many locations. Common use offices in many locations lacked accessible light switches and outlets, and offices lacked accessible desks, workstations and coat racks. Light switches, thermostats and fire pulls throughout the building are located above 48" due to previous model codes allowing a 54" high reach range for controls and mechanisms. The 2010 ADA Standards for Accessible Design set a more stringent standard which is used for this report.

Stairway handrails throughout the building lacked accessible extensions and grip height. Stairway level identification signage was also lacking for the visually impaired. Common use areas, hallways and corridors lacked visual signal appliances (strobes) on the basement, first, second floors and the mezzanine level. Fire extinguisher cabinets were identified with controls at a non-accessible height and in some instances, non-accessible cabinet hardware. Hand sanitizers provided in public spaces were also not identified within accessible reach ranges.

Men and women’s restrooms were identified on the basement level but the only accessible restrooms in the building are located on the first floor. A significant increase in square footage will be necessary to provide access in the existing restrooms in the basement. The basement facilities also lacked ISA directional signage indicating the location of and route to the accessible restrooms. No accessible drinking fountains were identified in the basement or throughout the building. At least one hi-low drinking fountain should be installed on each floor for use both by people of short stature or wheelchair users and taller individuals with bending and stooping injuries. When this is completed, ISA directional signs should be placed at the non-accessible fountains to indicate the location of and route to the accessible fountains on each floor.
The basement lobby area is a well-traveled space from which both restrooms are not clearly visible. It is recommended as a performance standard, that lobby identification signage be provided in this building that indicates the floor plan, the location of the person viewing the sign and the location of accessible features such as restrooms, elevator and drinking fountains in proximity to the location of the person reading the sign.

The elevator provided for public use in the building was tested and identified as accessible. Functional issues identified with the elevator included the door delay required to re-open when the doors meet an obstacle that did not have at least 20 seconds of delay, car control buttons which did not illuminate and non-accessible door hardware on the emergency control cabinet door.

Classrooms in the basement were identified with accessible desks but group tables were identified as pedestal-based which lack accessible knee clearance. Classroom spaces also lacked entry doors that operated with accessible opening force, accessible emergency phones, first aid kits and tactile exit signs.

Accessible signage was lacking for visual signs in most of the building, including at stairways throughout the building. Some tactile signs were identified at some restrooms and classrooms but the location of the tactile information on each sign was not considered accessible as compared with the 2010 ADA Standards.

Many staff use only areas were identified in the building. These spaces include IT offices, janitorial room, faculty offices and associated spaces. Signage at the door/doorway to these spaces was included in this report as it is located along the public pedestrian route of travel although the interior spaces were not investigated as part of this assessment process. (In general, institutions and organizations make staff-use-only areas accessible as needed through the reasonable accommodation iterative process between the employer and employee.)

FIRST FLOOR

In addition to the barriers listed above in the common use areas, the first floor and upper floors were found to have central hallways with ramp and stairway combinations that were to provide access for people with mobility impairments. The ramps provided were covered with a tile surface that did not appear to provide accessible slip-resistance and the running slopes measured exceeded the maximum allowable slopes at each ramp. The adjacent stairways were identified with solid black treads which may be difficult for those with low vision to navigate as they lacked color contrast. As a performance standard, it is highly recommended to provide contrasting color at stairway treads to improve visibility for all users.

A drinking fountain was identified in the lobby that could serve people with bending and stooping injuries but those of short stature and wheelchair users would not be able to access the high bubbler. A horn associated with the fire alarm system was also identified in the lobby but no strobe was provided.
for the hearing impaired. ISA directional signage is posted in two locations in the central lobby area pointing to the accessible restrooms (see photo with arrows at left). The signs show a stylized ISA symbol but they lack the internationally recognized standard showing a white wheelchair symbol on a blue background. As a performance standard, it is recommended that ISA signs conform to international standards that are widely recognized by people with disabilities. The blue color would also stand out well in the area otherwise characterized by neutral colors.

Accessible men and women’s restrooms are located on the first floor. The configuration of the entrance doors presents issues with maneuvering clearance, and the lack of accessible door operating force and sweep period could be served by installing automatic door opening devices. Signage provided lacked accessible tactile characters including pictograms. Other barriers identified in the accessible restrooms included dispensers and mirrors at locations that were not accessible, lavatories and urinals that lacked accessible rim height, control height and projection from the back wall. The water closets lacked accessible maneuvering clearance for the stall entry doors, accessible stall door hardware, grab bars, dispensers and toilet seat height. Visual signal appliances (strobes) were also not identified in the accessible restrooms.

The department offices for the College of Science and the Media Center are located on the first floor. These spaces were identified with barriers similar to those listed above in addition to a public service counter and PC located at the entry area at the College of Science that both lacked accessible surface height. The College of Science department appeared to have been renovated recently. The conference room within the College of Science department spaces lacked an assistive listening system, a visual signal appliance (strobe) and a coat rack at an accessible height. A kitchenette within the College of Science department spaces also lacked accessible counter space, knee clearance at the sink or reach range to allow use of the microwave.

The Media Center was identified with an accessible service public counter in the entry area although the associated conference room lacked an accessible group table. The copy room serving the Media Center was identified reach range and maneuvering clearance issues due to the limited square footage available. Strobes were not identified in any of the Media Center spaces although a visual signal can be important in a high noise area such as a copy room.

Classroom space and computer labs for the Math department are located on the first floor. Similar barriers to access were indentified in this space although accessible desks were identified in the Math Lab classrooms on this floor.

MEZZANINE LEVEL

The mezzanine level provides office space for graduate students from both the Statistics and Foreign Language departments and is located directly above the first floor math lab area. Vertical access to the mezzanine is provided both by way of a narrow stairway and by a passenger elevator for use by all visitors. Directional signage is recommended at the entry to the narrow stairway indicating the location of and route to the elevator.

A ramp leading from the elevator to the mezzanine level was identified with accessible handrails but the ramp surface consisted of tile which was not slip-resistant and the ramp slope exceeded 8.3%. Barriers described above in offices were typical in the public office spaces in the
mezzanine. No visual signal appliances (strobes) were identified in the mezzanine level although a fire pull was located adjacent to the exit stairway door above accessible reach range and in a corner where a wheelchair user may have difficulty reaching it.

SECOND FLOOR

The second floor provides space for the Foreign Languages department, multiple classrooms and offices for staff, faculty and graduate students. The Foreign Languages department office was identified with barriers found in other spaces in the building including an entry door that lacks accessible clear width, signage, opening force and hardware. The interior space of the office provides testing areas that also lack accessible desks and maneuvering clearance. The department conference room was identified with an accessible counter but the associated sink, microwave and group tables were not identified as accessible. The department copy room was also identified with similar barriers including a lack of a strobe which can be important in a high noise area such as a copy room. Non-accessible restrooms (two single accommodation and one men’s multi-accommodation) were also identified on the second floor. Directional ISA signs were posted on the multi-accommodation restroom but the sign characters and symbols were not sized to be viewed at a distance as people approach the entry door. It is also recommended that internationally recognized standards for ISA sign coloration be utilized (white-on-blue symbol colors). A ramp and stairways connecting different levels on this floor were also identified with the same barriers as those on the first floor.

Classrooms 236 – 238 on the second floor were identified as lacking accessible signage, accessible entry doors (clear width, door operating force, hardware and signage were not accessible), emergency phones, light switches, pencil sharpeners and teaching podiums. Accessible desks were provided in each of these classrooms but the desks were found to be turned to face the wall rather than the instructor. This could be due to a lack of use and could easily be remedied. Other classrooms on the second floor appeared to have been remodeled recently although the entry doors lacked accessible operating force and signage. Classrooms 202, 274, 278 and 280 were identified with desks lacking accessible knee clearance and a raised dais on which the instructor’s podium was located. The change in level was more than 6 inches and no ramps were provided to allow students with mobility impairments to reach the instructor as part of the learning experience. The podiums were adjustable but not accessible as a shelf installed below the work surface encroached into knee clearance and the base reduced toe clearance considered as accessible. Other minor barriers were identified inside the classrooms such as a lack of maneuvering clearance and accessible reach range at emergency phones. No strobes were identified in classrooms within the building. Corridors on the second floor were identified with ceiling mounted strobe devices.

THIRD FLOOR

The Mathematics department office is located on the third floor, as well as staff and faculty offices, a single accommodation non-accessible women’s restroom and a non-accessible men’s
multi-accommodation restroom. Two larger auditoriums are also provided on the third floor. Barriers described in offices and hallways/corridors above were also identified in these spaces on floor three although existing strobe devices on this floor were identified as wall-mounted. Each auditorium space lacked accessible entry door signage, operating force or wheelchair accessible seating. A raised dais was identified in each space on which the instructor’s podium was located. Emergency phones were also located on the raised dais. The change in level was more than 6 inches and no ramps were provided to allow students with mobility impairments to reach the instructor as part of the learning experience. Graduate student offices on this floor were identified with barriers found in similar spaces on other floors (non-accessible entry doors, desks, light switches, coat hooks, etc. A ramp and stairways connecting different levels on this floor were also identified with the same barriers as those on the first floor. The following barrier data records provide more detailed information on the barriers described above.
