Re: ADA Accessibility Survey and Assessment – Owen Hall

Dear Angelo,

We are pleased to submit this report for Owen Hall. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on May 28, 2014. The exterior site elements were assessed originally as part of the pedestrian facilities assessment in June-September 2011 and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access, to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

Owen Hall is considered a post-ADA structure and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No “perfect” building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire on the part of OSU to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways;

1. **Narrative Analysis:** The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified but also provides a discussion that analyses the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

   **NOTE:** Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. **Barrier Data Records:** Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.

   In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.
A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve Owen Hall. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks as paved surfaces improved for use by pedestrians but walkways are not located along or adjacent to the curb line, gutter or roadway and walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.

As a public building governed by the ADA Standards, Owen Hall should have at least one accessible entrance. An accessible grade level entrance was identified at the center of the building on the south side located along SW Campus Way. Owen Hall has connection to the accessible route within campus from the site to accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public
transportation stops to the accessible building or facility entrance they serve\(^1\) as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided within the ADA Assessment and Survey of the pedestrian facilities provided as a separate report, as well as in the following records. Please see the barrier data records for details.

B. Building Entrances

The building is located along SW Campus Drive within campus. No on-site parking is provided. An accessible grade level pedestrian entrance to the building is provided on the south side of the building centrally located. Stairways are located at several locations around the building and ISA directional signage is recommended for these locations to help ensure that pedestrians seeking an accessible entrance are not forced to retrace their steps.

INTERIOR SPACES

FIRST FLOOR

Owen Hall is a five-story building with a basement. The building is a pre-ADA structure with public use on floors 1 through 4. An elevator provides vertical access through the building and the elevator is large enough to serve as a medical emergency elevator, although no signage is provided to indicate that function. The main entry door is part of an entry vestibule with glass doors that are original to the building. At the time of construction, building code did not specify the need for 10\(^\text{th}\) high smooth, uninterrupted surfaces at bottom of doors to ensure that when the footrests of wheelchairs made contact with the doors to push them open, they did not make contact with glass. A kickplate can be installed on these doors as a safety measure which is now standardized in the building industry. This main entry door was identified with non-accessible operating force, but the west entrance door was identified with an automatic door opening device, rather than the main entrance. ISA directional signage should be posted at main entrance to the south and the north entrance to direct people to the existing accessible entrance to the west.

The open lobby was identified with displays and visual information that is not accessible to the sight impaired. Some objects on display also created protruding objects in the circulation route. The central open stairway was identified with original handrails that were not accessible and the brick floor surface appeared to lack slip-resistance, although it was not tested.

Barriers identified in these spaces were identified throughout the building in common use areas and include signage with raised letters that are not all uppercase. Classrooms 102 and 106 are ground level auditoriums with entrances from the open lobby. Entry doors to the space lacked accessible signage, the door landing was identified with a significant slope and the doors were very heavy at both auditoriums. Automatic door opening devices could help to minimize those barriers at both auditoriums although 106 has two entry doors and only one needs to be made accessible. Auditorium 102 was identified with 112 fixed seats and auditorium 106 was identified with 49 fixed seats. Both auditoriums had a sloped (raked) floor. No assistive listening system was identified in either auditorium. There was a desk in the back row identified as an accessible desk in 102 but no desks were identified as accessible in 106. The floor under the back row of desks is where the floor begins to slope downward resulting in a steep slope that will cause people using

\(^1\) 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points
wheelchairs to pull forward when seated at the desks. The maneuvering clearance at the back row of desks was measured with a 46" turning space where a 360 degree change in direction is necessary when using the desk. Considering the existing floor, the back row was the simple choice to locate wheelchair accessible seating although it was not accessible.

The issue of concern is that participation in instruction must allow students to travel through the auditorium to reach the instructional area. At present, no accessible route exists between these desks and the instructor’s area. Ramps at each side of the floor have steep slopes, non-accessible cross slopes and have no handrails or level landings that are needed every 30 feet for resting and changing direction, as well as at the top and bottom of each ramp. At the instructor’s area, at least one whiteboard was not located at an accessible height to allow short people space to write.

The podiums in classrooms on this floor were adjustable but not accessible, as a shelf installed below the work surface encroached into knee clearance and the base reduced toe clearance considered as accessible. The work surface is adjustable but the rim is 1" thick. A shelf was installed below the work surface that extends 8-1/2" below the work surface. Adding the 1" work surface and the shelf makes the entire surface 9-1/2" high, where the allowable difference between accessible knee clearance and work surface height is only 7" (27" to 34"). Please see the figure above indicating accessible knee and toe clearance.

Classrooms 101 and 103 were identified with similar barriers, including a lack of accessible route to the instructor’s area and the emergency exit door lead to a door landing that was a large metal grate with openings that could trap wheelchair wheels. These classrooms have projection rooms located adjacent to the entry doors and the projection room doors may appear as exits to people leaving quickly in the case of an emergency. This configuration is not advisable in the design phase, but in an existing building, it is important to provide tactile exit signs at the actual exit doors. One accessible desk was provided in each of these classrooms at a level location in the back of the classroom. No accessible route was provided to the instructor’s area in these classrooms.

Most of the public spaces on the first floor were identified with entry doors located in recessed doorways which may prevent people using wheelchairs from approaching and operating the door hardware. The lack of accessible maneuvering clearance may necessitate the installation of automatic door opening devices at entrance doors to classrooms or offices even in instances where door closers are not provided. In many cases, light switches and outlets were not located within accessible reach range. In some instances, in classrooms and offices, the clear floor space needed to enable use of whiteboards and chalkboards was blocked by furniture or stored items.

Most of the signage in the building provided visual information but lacked tactile information (Braille and raised letters) for the visually impaired. In some common use areas, visual signal appliances (strobes) were not provided to alert the hearing impaired during an emergency. Fire alarm actuators (fire pulls) appeared to be original to the building. The actuators were identified outside of accessible reach range and did not appear to be fist operable for people with hand impairments. That group of people with disabilities is one of the largest groups, as it includes the elderly as well as many people with other mobility issues.

The building has an elevator to provide vertical access to all floors. The elevator lacked accessible signage on door jambs indicating floor level, or discharge level. Other barriers to access identified
at the elevator include non-accessible hall call buttons that were not at an accessible height and that did not illuminate for those with visual impairments, no audible signals were provided and the emergency communication system provided necessitated the ability to have voice communication by using a handset to call for help, which is prohibited by the ADA Standards and ASME Standards, as it prevents use by people with speech impairments.

Stairways in the building appeared to have original handrails that lacked accessible extensions and grip height and appeared to lack slip resistant surfaces. Doors in stairway entrances were not identified as accessible and lacked accessible hardware. These doors needed simultaneous thumb activation and pulling to open. View panels and opening force were also identified as non-accessible. Tactile exit signs indicating where doors lead to exits, including exit stairways are also recommended in this building. The stairways lacked level identification signage for the visually impaired and no contrasting color was identified at the stairway treads which can be important to those with low vision. As a performance standard, it is highly recommended to provide contrasting color at stairway treads to improve visibility for all users. An exit door within the central stairway lead directly to the exterior but there was no door landing and the exit path consisted of a significant drop to the grade level ground. Although this exit is not part of an accessible route, it may be used by people with disabilities who do not have mobility impairments.

A single drinking fountain was provided on the first floor. The fountain was low and intended to be wheelchair accessible, but knee clearance was not accessible and the fountain was not located within an alcove or otherwise provided with detectable warnings for the visually impaired. No high fountain was provided for people with bending and stooping injuries on this floor. Men and women’s multi-accommodation restrooms were provided, but the entry vestibules were identified with non-accessible signage, heavy doors and maneuvering clearance that was not wheelchair accessible. Paper towel dispensers protruded into the circulation path and the facilities lacked an accessible lavatory or urinal and the toilet stalls lacked adequate clear width or maneuvering clearance to allow a wheelchair user to enter or transfer. These rooms also lacked a strobe device.

The locations of accessible features in this building were not readily apparent to visitors. Lobby informational signage was not provided in the building to indicate the location of these accessible features. As a performance standard, it is recommended that lobby identification signage be provided on each floor in each central corridor that indicates the floor plan, the location of the person viewing the sign and the location of accessible features such as restrooms, elevator and drinking fountains in proximity to the location of the person reading the sign. Although the accessible features provided in the building are located in the central corridor, people with low vision may benefit from the information provided within the recommended lobby identification sign.

Many staff use only areas were identified in the building. These spaces include workrooms, laboratories, janitorial rooms, private faculty offices and associated spaces. Signage at the door/doorway to these spaces was included in this report as it is located along the public circulation route of travel, but these interior spaces were not investigated as part of this assessment process. In general, institutions and organizations make staff-use-only areas accessible as needed through the reasonable accommodation process between the employer and employee.

SECOND, THIRD and FOURTH FLOORS

The second and third floors provide classrooms, a counseling office, conference rooms, meeting rooms, offices and teaching labs. A corridor connects Owen Hall to Kearny Hall on floor 2 and 3. The double doors are equipped with an automatic door opening device that operates one leaf but
accessible signage is not provided. This location would be a good place to post lobby informational or way finding signage.

A single low drinking fountain was provided on this floor in addition to Men and women’s multi-accommodation restrooms. Barriers identified in these spaces were similar to those noted on floor 1. Corridors were also identified with a lack of accessible signs, including lobby informational signs and information to describe visual elements on display to people with vision impairments. Fire extinguishers and electrical outlets in the corridors were not identified as accessible. The elevator on this floor was identified with barriers note above.

Computer Lab 241 was identified with no accessible PC stations where 58 were provided and the instructor’s podium was the adjustable type described above. Graduate student offices were identified with non-accessible entry door operating force, door hardware, view panels accessible to short people and wheelchair users and non-accessible maneuvering clearance blocked by file cabinets, furniture or stored items. Also, these spaces lacked access at printers, workstations and desks. Many of the offices lacked maneuvering clearance needed by wheelchair users at entry doors and within the circulation route through interior spaces of the offices. Controls such as light switches, electrical outlets and shelves were also not accessible in the offices. In some instances, furniture could be removed to provide access. Where that is not possible, offices may need to be moved into additional space to ensure access.

Conference rooms on these floors were identified with barriers similar to those in classrooms, etc. but the rooms also lacked accessible group tables. Accessible knee clearance was not identified at any of the tables in these rooms. No assistive listening devices were provided in these rooms where more than 10 seats at the conference room table were provided. The transportation professional resource room 308 in the third floor was also identified with a large table that blocked passage through the room and could prevent use of the kitchenette on the far side of the room.

On the fourth floor, the east corridor was identified with a large table that blocked wheelchair access in the corridor. That is a barrier to access, but the corridor is also an emergency exit corridor leading from laboratories, graduate student offices and a conference room to an exit stairway. Graduate student offices were similar to those described above with non-accessible signage, narrow entry doors, non-accessible door maneuvering clearance and non-accessible sinks, where provided. In some cases, there were so many stored boxes and equipment, in addition to bookcases and furniture, that passageways were reduced to less than 2 feet (see photo at right).

Many rooms have adequate square footage to enable access but the spaces have been filled with furniture and desks that combine to hinder or prevent access. Interior spaces generally lacked accessible desks, coat hooks and maneuvering clearance in some cases. In some cases, existing furniture could be rearranged but in many cases, the existing furniture (desks, bookcases, file cabinets, etc.) should be exchanged for smaller versions or removed to ensure access.

The following barrier data records provide more detailed information on the barriers described above.

ADA Assessment and Survey 2014
### Barrier Description:

- **Lavatory adjacent to wall not min. 15" to the centerline of fixture**

### Findings:

- **14-1/4" - 14-1/2" to centerline of fixture at both sinks**

### Rec. Solution:

- **Move at least one lavatory to provide accessible knee clearance**

### Barrier Severity:

- **2 Recommended**

### Implementation Priority:

- **3**

---

### Barrier Description:

- **Mirror at lavatory/countertop not max. 40" AFF at edge of reflecting surface**

### Findings:

- **41" high**

### Rec. Solution:

- **Replace or remount mirror**

### Barrier Severity:

- **3 Hindrance**

### Implementation Priority:

- **3**

## Barrier Description

### 73T

**Use of outlet involves low reach of less than 15" above floor or more than 48" high**

---

### 73U

**Clear floor space of min. 60" in diameter not provided where 360 degree turn is made**

---

### Recommendations

#### 73T

- **Rec. Solution:** Relocate outlet to area at min. 15" or max. 48" high

#### 73U

- **Rec. Solution:** Rearrange furniture/equipment to provide min. 60" turning space
