Re: ADA Accessibility Survey and Assessment – Valley Library

Dear Angelo,

We are pleased to submit this report for the Valley Library. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on April 22, 2014. The exterior site elements were assessed originally as part of the pedestrian facilities assessment in June-September 2011 and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access, to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

The Valley Library building is comprised of both pre-ADA and post-ADA areas including an alteration performed in 1996 and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No “perfect” building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire on the part of OSU to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways:

1. **Narrative Analysis:** The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified but also provides a discussion that analyses the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

   **NOTE:** Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. **Barrier Data Records:** Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.
In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.

A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve the Valley Library. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing on one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks as paved surfaces improved for use by pedestrians but walkways are not located along or adjacent to the curb line, gutter or roadway and walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.

As a public building governed by the ADA Standards, the Valley Library should have at least one accessible entrance. Accessible entrances were identified at the north side of the building on floor 2 and on the east side of the building on floor 1. The Valley Library has an accessible route provided within the site from accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public transportation stops to
the accessible building or facility entrance they serve\(^1\) as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided within the ADA Assessment and Survey of the pedestrian facilities provided as a separate report, as well as in the following records. Please see the barrier data records for details.

B. Building Entrances

The building is located on the corner of Waldo Place and SW Jefferson Avenue in the center of campus in front of a large Quad area. No parking is provided on-site. Grade level accessible entrances are located on two sides and levels of the building.

INTERIOR SPACES

FIRST FLOOR

The Valley Library is a six-story building with multiple elevators. The building is provided with an entry lobby on floors 1 and 2 with circulation space, service desks, study rooms, classrooms, meeting rooms and men and women's restrooms, as well as lactation rooms on each floor. Automatic door opening devices were provided at both accessible entrances, although ISA signs identifying the doors as accessible were not provided. The lobby, corridors and entry doors to public and staff areas throughout the building were identified with tactile signage but the Braille was not located far enough from the raised characters to allow reading. Braille dots were not domed or rounded or located directly below tactile characters. In general, the tactile signs in the building were quite complex, multi-colored, multi-segmented signs that were not accessible. Where provided, ISA symbols were less than 1” high and part of a collage of information on the signs that may be difficult for the visually impaired to decipher (see photo above).

The first floor is segmented into two sections. One section can be accessed by the accessible entrance door located on the east side of the building. The second section can only be accessed by use of the central or loading dock elevators. The Rotunda Cafeteria was located near the east accessible entrance. The cafeteria lacked accessible food service counters, tables and condiment counters. The men and women's restrooms located near the cafeteria were identified with a number of barriers to access, the most important being a lack of maneuvering clearance at both entrance doors due to a high-low drinking fountain which is located between the entrance doors to the two facilities and the doors are heavy and lack accessible signage.

\(^1\) 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points
The facilities also have dispensers that protrude into the circulation path by more than 4”, the lavatories are installed in counters that are higher than 34” and drainpipes have no insulation. This is typical throughout the facility. The toilet stalls lacked accessible hardware, grab bars and dispensers were also not in accessible locations within the stalls.

Overhead signs are posted in many locations within corridors that are accessible to people without vision impairments but for those with low vision or who are non-sighted that cannot see above 80” high, the signs are not accessible. It is recommended to provide tactile signage with the same information at doorway entrances to these areas along the central corridors (see photo at left).

Six elevators are provided in the building. Two elevators are located within the central corridor and across from the men and women’s restrooms, a two-stop elevator is also provided near the main entrance on floor 2 that connects the first floor café area with the second floor and another elevator is located within the loading dock that is used by staff and student workers. The first floor is segmented and the rest of the floor can only be accessed by using the central elevators which are quite far from the location of the elevator serving the café and the central elevators are not visible from the entrance. Both elevators lack door jamb signs that indicate discharge level. The elevator doors also lacked adequate door delays, self-leveling capability at the elevator that serves the café, as it arrives with a lip of one inch or more at each floor. Car call buttons are not located within accessible reach ranges and the buttons do not illuminate to indicate travel and audible controls or signals do not function. The emergency controls function through the use of voice communication which may not be possible for people with speech or hearing impairments.

Open study areas were identified on the first floor with study carrels that had accessible knee clearance but electrical outlets necessary for use of personal digital devices (PCs, tablets, phones, etc.) were not within accessible reach ranges. Book stacks were not identified with an accessible route and in some areas, the way in which the stacks were arranged on the floor encroached into the clear width needed by people using mobility assist devices to travel through the stacks. Stairway exit doors on this floor also lacked accessible tactile signage. Presentation Room - Group Study rooms and a lactation room located on this floor also lacked accessible signage, entry doors and adequate maneuvering space to allow people using wheelchairs to enter and close the door.

Central restrooms, including an accessible Family Restroom were located on floor 1 were identified with barriers similar to the restrooms described above near the cafeteria. High-low drinking fountains are provided in the corridor leading to the elevator lobby across from the men and women’s restrooms on each floor. The fountains are located in an alcove but the alcove is not deep enough to conceal the entire fountain, resulting in a protruding hazard. On this floor and other floors, the knee clearance measured was not at least 27” high and most fountains did not operate with 5 pounds of operating force or less. Group study rooms are provided on the first floor and most floors in the building. Accessible group study rooms are also provided but these rooms lack accessible signage, accessible tables and adequate maneuvering clearance to allow a person using a wheelchair to enter the room and maneuver to use the table and whiteboard. In these instances, it may be necessary to remodel the rooms identified as accessible to provide wheelchair access.
SECOND FLOOR

The main accessible entrance to the building is located on this floor across from the main Quad. A book depository was located outside of the entrance door but the control to operate the drop was not located within accessible reach ranges. Although accessible sliding doors were provided in the entry vestibule, the entry doors were found to be lacking ISA signage, especially important in the case where all doors in the vestibule were not accessible. One door remains locked within the vestibule and is separate from the sliding doors. Vending machines in this area were also identified with controls that were not located within accessible reach ranges.

A number of stairways were identified in this building. The handrails at all stairways were accessible but tactile exit signs indicating where doors lead to exits, including exit stairways are also recommended in this building. Doors at stairway entrances within open study areas were not identified as accessible and existing tactile signs were not accessible. The stairways were identified with signs provided for emergency personnel that provide information such as roof access and stairway number with no tactile information. These particular signs have far more information than is needed for the visually impaired in the case of an emergency. Also, no contrasting color was identified at the stairway treads which can be important to those with low vision. As a performance standard, it is highly recommended to provide contrasting color at stairway treads to improve visibility for all users.

The digital services area to the right of the entrance was identified with 4 different service desks all located along a lengthy counter. At the end of the counter, a lower section of counter was identified but it was not staffed. Policies and practices should be reviewed to ensure that all 4 types of services provided at the separate service desks can be provided at the single lower desks. Long lines are common in that area and staffing should be adequate to serve short people and people using wheelchairs with the same services as those provided to the able-bodied visitors. Two PC stations are also provided in the digital services area that both lack accessible knee clearance. At least one of those stations should be usable for people with wheelchairs. The circulation desk was identified with accessible service counter areas.

Restrooms were located centrally within enclosed corridors that were not visible from either accessible entrance. Also, many activities take place in the building which may be difficult for visitors with disabilities to locate. Lobby informational signage and ISA directional signs were not identified in this building. Considering the complex nature of this facility, lobby informational signs could be very helpful to many visitors. As a performance standard, it is recommended that lobby identification signage be provided on each floor in each central corridor that indicates the floor plan, the location of the person viewing the sign and the location of accessible features such as restrooms, elevator and drinking fountains in proximity to the location of the person reading the sign.

Computer reference areas were located within the central east-west corridor on all floors other than 3. Those areas provided digital card catalogues, PC stations, copier machines, microfiche and microfilm readers. The counter where the PC stations, etc. were located was a fixed counter with a surface of 36" high and no knee clearance was provided for people using wheelchairs. Counter surfaces higher than 34" result in controls or mechanisms that are not accessible (keyboards, computer mice, electrical outlets). Some free-standing optical recognition scanners were also located on upper floors and the controls and scanner beds were not within accessible reach ranges. Accessible built-in desks were provided on some of the upper floors but the desks did not all have PC computers at the desks. The Photocopy Center and Microcomputer Area on floor 2 were also identified with similar issues as described above. The Photocopy center lacked
accessible workstations, copier card readers and copier card vending machines. The Microcomputing center was identified with 28 Mac stations in a zig-zag configuration that lacked accessible knee clearance and 18 computer stations in a circular 6 seats configuration that were not wheelchair accessible.

Collaborative Learning Center East and West were identified as open study areas with three different types of desks with pedestal bases that were not wheelchair accessible. Study carrels were identified on this floor with accessible knee clearance but electrical outlets necessary for use of personal digital devices (PC's, tablets, phones, etc.) were not within accessible reach ranges.

Many *staff use only* areas were identified in the building. These spaces include offices, storage rooms, janitorial rooms, mechanical or electrical rooms and associated spaces. Signage at the door/doorway to these spaces was included in this report as it is located along the public circulation route of travel, but these interior spaces were not investigated as part of this assessment process. In general, institutions and organizations make staff-use-only areas accessible as needed through the reasonable accommodation process between the employer and employee.

Barriers identified on this floor were identified throughout the building in common use areas and include entrance doors that lacked accessible signage and door closer operating force/sweep period where door closers were installed. Franklin A McEdward Reading Area was identified with accessible study carrels but the lockers provided in the area were not accessible. The Thomas & Beverly Hartung Gallery was identified with accessible passage but the art objects in the space were not accessible to those with vision impairments. It is recommended to provide information in an alternate format describing those visual objects to provide access to people with vision impairments.

The Autzen Classroom was identified with non-accessible signs and entry doors. The classroom was provided with 24 Mac workstations and none were accessible.

### THIRD FLOOR

Signage and public use areas on this floor were similar to those described above. The Government Documents Area and Library Catalogue Area lacked an accessible circulation route through the area and the service counter at the catalogue desk also lacked an accessible section for short people or people using wheelchairs. Entry door signage at the Williamette East & West Meeting rooms was not accessible and both rooms lacked podiums that had accessible work surface height or accessible controls. Assistive listening systems were not provided in the conference or meeting rooms. A kitchenette/break room used on this floor was identified with the same signage issues as described above including a non-accessible first aid kit, and a kitchenette counter lacking accessible workspace next to the stove and sink. The stove controls operation entailed reaching over hotplates, which could be a safety risk for short people or people using wheelchairs.

Private study rooms are located along the east end of building and all of these rooms were identified with rectangular pedestal-based tables other than the last room designated as an accessible study room.

Men and women's restrooms in the building were identified in one location on each floor. The restrooms lacked accessible entry doors and automatic door opening devices are recommended. Signage at the restrooms was similar to the signs described above with non-accessible Braille,
dispensers created protruding hazards within the circulation path in each facility and lavatory counters were higher than 34”. Urinals located in men’s rooms were not accessible. In addition, knee clearance was not accessible due to a cover placed over the drainpipes which encroached into knee clearance necessary for people using wheelchairs. Toilet stall doors did not self-close, hardware was not provided, grab bars were not located in accessible locations and dispensers located with the stalls were not accessible.

The Day Care Center on the 3rd floor was located in a small space with an entry door, a large view panel and no door closer device was installed, but the door was located within a few inches of a service counter which blocked maneuvering clearance at the exit side of the door. Also, the counters between the entry service area and the play area were only 27-1/2” apart (see photo at left) which could prevent parents who use wheelchairs from entering the play area to tend to their children. Service counter surfaces were also not at an accessible height.

Family/Assisted Restroom on floor 3 was provided with an automatic door opening device but the device lacked an ISA symbol that was large enough to view from a distance. Otherwise, barriers identified in the facility were similar to those described above. A kitchenette within a conference room was also identified with non-accessible counters, sink and dispensers.

FOURTH FLOOR

Barriers identified on this floor in study areas, book stacks, restrooms, elevators, classrooms and stairways were similar to those noted above. The Administration & Consulting Services department on this floor was identified with an accessible entry door with an automatic door opening device that was not identified with an ISA symbol and BHMA “automatic door” signs were not posted on both sides of the entry door. These signs are important for both able-bodied people and for those with disabilities that would access the door opening device. Some tactile signs that are intended to be read by touch on this floor were located behind shelves that blocked approach to the signs and doors (see photo at right).

FIFTH AND SIXTH FLOORS

Barriers identified on this floor in study areas, book stacks, restrooms, elevators, classrooms and stairways were similar to those noted above. The Special Collections Reading Room on this level was identified with a number of displays that lacked information accessible to the visually impaired. Group study rooms were provided and some rooms were designated as accessible study rooms, although the door signage was not accessible and the rooms were provided with pedestal based tables that lacked knee clearance and also blocked use of whiteboards provided in each room. The study rooms designated as accessible rooms were quite small and may need to be expanded to provide wheelchair access.

The following barrier data records provide more detailed information on the barriers described above.
